

## Ideas for Closing Performance Gaps

### Key Activity: Perform Cholesterol Screening and Follow-up

**Rationale:** “Significant evidence exists that using family history of premature CVD or of cholesterol disorders as the primary factor in determining lipid screening for children misses approximately 30-60% of children with dyslipidemias, and accurate and reliable measures of family history are not available. (Grade B) In the absence of a clinical or historic marker, identification of children with lipid disorders that predispose them to accelerated atherosclerosis requires universal lipid assessment.”

Potential Barriers	Suggested Ideas for Change
<b>Gap: A nonfasting cholesterol screen is not completed for patients once between the ages of 9 and 11 years or once between the ages of 17 and 21 years.</b>	
Practice only conducts cholesterol screening for patients with elevated BMI or a family history of heart disease or high cholesterol.	<ul style="list-style-type: none"> <li>Provide staff members with knowledge about the importance of preventing the development of cardiovascular risk factors and optimize cardiovascular health.               <ul style="list-style-type: none"> <li>See the American Heart Association’s Children and Cholesterol page, available at: <a href="http://www.heart.org/HEARTORG/Conditions/Cholesterol/UnderstandYourRiskforHighCholesterol/Children-and-Cholesterol_UCM_305567_Article.jsp">http://www.heart.org/HEARTORG/Conditions/Cholesterol/UnderstandYourRiskforHighCholesterol/Children-and-Cholesterol_UCM_305567_Article.jsp</a></li> <li>Provide clinical staff with training about the revised cholesterol testing guidelines.</li> <li>Review <a href="#">NIH Integrated Guidelines for Cardiovascular Health and Risk Reduction in Children and Adolescents</a>:                   <ul style="list-style-type: none"> <li>Chapter 9, <i>Lipids and Lipoproteins</i> recommendations; and</li> <li>Table 9-5. Evidence-Based Recommendations for Lipid Assessment</li> </ul> </li> </ul> </li> </ul> <p>Note: Nonfasting is a quicker and more convenient test for children and adolescents in these age ranges, but ONLY if there are no risk factors. If risk factors exist, administer a fasting lipid profile. See an explanation on pages 5–7 of the <a href="#">Promoting Healthier Weight</a> resource from the Vermont Department of Health.</p>
Physicians are unfamiliar with appropriate laboratory tests for pediatric patients.	<ul style="list-style-type: none"> <li>Review with staff when to use which screening: fasting vs nonfasting               <ul style="list-style-type: none"> <li>See Chapter 9, Table 9-5. Evidence-Based Recommendations for Lipid Assessment from the <a href="#">NIH Integrated Guidelines for Cardiovascular Health and Risk Reduction in Children and Adolescents</a>.</li> <li>See the recommendations for when to use <a href="#">fasting/nonfasting screens</a> at the end of this document.</li> </ul> </li> </ul>

Potential Barriers	Suggested Ideas for Change
Practice is not reimbursed appropriately for testing and follow-up services.	<ul style="list-style-type: none"> <li>• Code correctly.               <ul style="list-style-type: none"> <li>○ Refer to the AAP <a href="#">Bright Futures and Preventive Medicine Coding Fact Sheet</a> that contains a comprehensive list of codes for the related services:                   <ul style="list-style-type: none"> <li>▪ See ICD-10-CM Code <b>Z13.220</b> Encounter for screening for lipid disorders.</li> </ul> </li> <li>○ Review the <a href="#">AAP Practice Management Online Web site</a> for additional resources.</li> <li>○ Contact the <a href="#">AAP Private Payer Advocacy Advisory Committee</a>.</li> </ul> </li> </ul>
Parents are reluctant to perform lab testing.	<ul style="list-style-type: none"> <li>• Send the parents a letter prior to the visit to cue that the testing may need to occur.</li> <li>• Consider purchasing a finger-stick cholesterol machine (for nonfasting screen) to perform the screen before the family leaves.</li> <li>• For adolescents, consider getting other screening at the same time with the same blood draw (eg, HIV screen).</li> </ul>
<b>Gap: Follow-up plan not established for patients with a positive nonfasting cholesterol screen.</b>	
Practice does not have an organized process for follow-up of positive nonfasting cholesterol screens with a fasting lipid profile.	<ul style="list-style-type: none"> <li>• For computerized offices, add preset order to the EMR.               <ul style="list-style-type: none"> <li>○ Add clear instructions to provide to families for fasting. See the recommendations for when to use fasting/nonfasting screens at the end of this document.</li> </ul> </li> <li>• Access hospital-based clinics or large health care organizations with subspecialty services for testing and treating adult patients, which may provide an organized menu of services/processes that can be adapted for pediatric practice.</li> <li>• Refer the patient to a local resource (Public Health Department or health clinic) for screening and follow-up.</li> </ul>
Staff and providers do not provide a personalized treatment plan for patients with a positive screen.	<ul style="list-style-type: none"> <li>• Develop a handout with basic information about the implications of the test results, treatment goals, management, and monitoring.               <ul style="list-style-type: none"> <li>○ Note: Be sure that materials are appropriate for the age of the patient.</li> <li>○ Handout should include information on lifestyle changes, including physical activity, smoking cessation, and nutrition.</li> </ul> </li> </ul>
Physicians are unsure about when, and which tests, to use pharmacologic interventions for young adults.	<ul style="list-style-type: none"> <li>• See the <a href="#">NIH Integrated Guidelines for Cardiovascular Health and Risk Reduction in Children and Adolescents</a>.</li> </ul>

### When to use fasting/nonfasting screen:

The guidelines sponsored by the National Heart, Lung and Blood Institute (NHLBI), part of the National Institutes of Health, and endorsed by the American Academy of Pediatrics (AAP) recommend that **all children be screened for high cholesterol at least once between the ages of 9 and 11 years, and again between ages 17 and 21 years.**

- A nonfasting cholesterol screen is completed for patients once between the ages of 9 and 11 years or once between the ages of 17 and 21 years.
- A follow-up plan is established for patients with a positive nonfasting cholesterol screen.

Age:	New Recommendation:
2–8 years	Obtain <b>fasting lipid profile only</b> if family history is positive (+), parent with dyslipidemia, any other RFs (+), or high-risk condition
9–11 years	Obtain <b>universal lipid screen</b> with nonfasting non-HDL = TC – HDL, or fasting lipid profile → manage per lipid algorithms as needed.
12–16 years	Obtain <b>fasting lipid profile</b> if family history newly (+), parent with dyslipidemia, any other RFs (+), or high-risk condition; manage per lipid algorithms as needed.
17–21 years	Measure <b>nonfasting non-HDL-C or fasting lipid profile</b> in all x 1 → review with patient; manage with lipid algorithms per ATP as needed. Measure BP → Review with patient. Evaluate and treat as per JNC guidelines.

#### **Children with special risk conditions**

If there are other risk factors, prescribe a fasting lipid screen regardless of the child's age. This includes instances where you identify a risk factor that wasn't present in earlier visits.

See [Tables 9-6 and 9-7](#) from the NHLBI Guidelines, which define risk factors.
